

# Visual Analytics—Color

Dr. Ab Mosca (they/them)

Slides based off slides courtesy of Jordan Crouser (<https://jcrouser.github.io/>)

# Notes

- Nice job on the mid-semester project!
- How was reading an academic paper?
- What did you learn from looking at VA systems?

# Plan for Today

- Color
  - How we see it
  - Spaces
  - Phenomenon
  - Pallets
- Lab

# Flashback: Mapping to visual dimensions

- Remember... **Big idea behind visualization**
  - Map data dimensions to visual dimensions in a principled way
  - Not all visual dimensions can represent all data types

# How we see color

What do you notice here?

How we see color

How we  
represent color

RGB

How we  
represent color

RGB

## Issues

- Distance between colors nowhere near how we perceive differences

A: (5, 7, 15)      B: (15, 17, 25)

rgb(0, 128, 0)

rgb(128, 0, 0)

rgb(10, 138, 10)

rgb(138, 10, 10)

How we  
represent color

HSV/L

**HUE** = Pure colors (not mixed with white or black)

**SATURATION** = Amount of white mixed with pure color

**VALUE/LIGHTNESS** = Amount of black mixed with pure color

How we  
represent color

HSV/L

## Issues

- Distance between colors is closer, but not identical to how we perceive differences

A: (5, 7, 15)

B: (15, 17, 25)

hsv(120, 100, 50)    hsv(130, 110, 60)

hsv(0, 100, 50)

hsv(10, 110, 60)

How we  
represent color

CIELAB

$L^*$  = Perceptual lightness

$a^*$  = unique color (red – green)

$b^*$  = unique color (blue – yellow)

# How we represent color

## CIELAB

### Issues

- Given numerical change corresponds to perceived change in color, but is computationally complex

A: (5, 7, 15)

B: (15, 17, 25)

lab(46.05, -51.55, 49.76)

lab(25.42, 47.91, 37.91)

lab(56.05, -41.55, 59.76)

lab(35.42, 57.91, 47.91)

# Color phenomena

Caveat 1: color is perceived in context

Color  
phenomena

Which small square is **darker green**?

Caveat 2: difference is relative

Color  
phenomena

Caveat 2a: so are brightness and contrast

Color  
phenomena

### Caveat 3: mental models > perception

Color  
phenomena

# Color palettes

- Using a poor color scheme can also cause issues with your visualization

# Color Problems

One color dominates

Difficult to distinguish

Murky

Fun fact:  
“colorblindness”

**1 out of every 8** people  
has just 2 types of color  
receptors (rather than 3)

What happens  
when you  
print?

- Need color scheme that converts well to grey scale

# Colorbrewer palettes

- [colorbrewer.org](http://colorbrewer.org) provides a whole bunch of palettes that can help us avoid these issues
- This makes life a lot easier for us!

## QUALITATIVE

set1

set2

pastel2

dark2

## SEQUENTIAL

blues

greens

reds

ylorbr

## DIVERGING

spectral

rdylbu

rdylgn

piyg

# Colorbrewer palettes

- [colorbrewer.org](http://colorbrewer.org) provides a whole bunch of palettes that can help us avoid these issues
- This makes life a lot easier for us!

When should we use each type of color palette?

## Mini-lab: color tricks

- Find a partner
- Open a dataset of your choosing
- Build two visualizations on this dataset
  - One that tells the “real” story in the data (as you understand it), using color to represent at least one variable
  - One that uses color in an intentionally misleading way

# Discussion

- What did you try?
- What did you learn about the data?
- Can you imagine a scenario that might incline someone to choose your “bad” visualization instead of a better one?
